

### Abstract

A process of forming a desired wall surface includes the steps of forming an opening in a preliminary wall; fastening shape structure within the opening; and finishing the shape structure and preliminary wall to achieve the desired wall surface. The fastening step may include the substeps of locating the shape structure within the opening, and attaching a region of the shape structure to the preliminary wall. The forming step may involve using a preliminary wall of an interior building, and may be done by cutting an opening in the preliminary wall. The fastening step may include the substep of choosing shape structure ultimately to form either a recess or protrusion in the desired wall.
